

YOUR RECYCLING CHOICE.

Henson Franklyn works towards a circular economy, progressing sustainable materials from manufacture to reusable clean energy and now, Second Life Usage. The choice is yours...

OPTION 1 ENERGY FROM WASTE

Lincolnshire is the proud owner of an energy from waste plant and Henson Franklyn currently sends all its business waste to this amazing facility. The factory currently manages approximately **190,000 tonnes** of waste and generates more than **105,500 MWh** of electricity for the national grid, enough power for more than **29,000 homes**.

Over many years we have been committed to providing and sourcing sustainably sourced materials that can be re-used or re-purposed. Three years ago we moved to water based paints reducing harmful surplus and waste from our finishing department. Use of PVC free printing material is now a reality and further developments within the industry are making the choices of material more widely available.

Henson Franklyn has an audited waste trail that delivers a 'zero to landfill' outcome and we continue to follow that option for our waste solutions. Since 2021 we have, together with our suppliers, developed an alternative option in Second Life Usage.

OPTION 2 SECOND LIFE USAGE

We now work with our supply partners in a waste management program provided by PRISMM Environmental. HF packages up its waste materials for recycling. The waste is shredded and processed into useable materials, some examples being equestrian surfaces, traffic cone bases and other applications where the non-virgin material can be used.

Henson Franklyn as standard will recycle your waste into Lincolnshires state of the art 'Energy from Waste' facility at no extra charge to our customers. Alternatively if you have a desire to recycle your waste into second usage products then we will happily provide a quotation to enable this to happen. Please advise us accordingly.
